The Ties that Bind  
The Central Florida Social Capital Survey

Marginal Results, County by County

By

James D. Wright and Jana L. Jasinski

Fall, 2005

This document contains the breakdown by county of all questions asked in the Central Florida Social Capital Survey (i.e., the county-by-county marginals). Please note the following technical details.

The Central Florida Social Capital Survey was a computer-assisted telephone survey conducted by the Survey Research Laboratory in the Institute for Social and Behavioral Sciences at the University of Central Florida. To assure adequate sample sizes, the seven counties were sampled at different rates and the results for the total survey are therefore weighted to compensate for sampling disproportions. The results shown here are also weighted to compensate for an over-sampling of women in each county. Each county's weight reproduces the exact gender distribution of the county according to the 2000 Census.

In all, 1,606 interviews were conducted. Of these, 139 were "break-offs," i.e., the respondent stopped answering questions before the end of the survey; complete surveys numbered 1,467. By county: 404 interviews were conducted in Orange county, 213 in Seminole, 147 in Osceola, 239 in Brevard, 224 in Volusia, 243 in Polk, and 136 in Lake County.

Each table shows eight columns of numerical data: the breakdown (raw counts and percentages) for each county separately and then the total result in the far-right column. In order to simplify the presentation, all tables shown here are based on the valid (non-missing) cases only. Missing cases (don't know, not applicable, refused, etc.) are deleted item-by-item.

In cases where the number of possible answers is such that the results could not be made to fit on one page, we have collapsed categories. So instead of the raw results to the question about how many hours of television respondents watch on the average day, we have collapsed into categories of no hours, one or two hours, three or four hours, and five or more hours. And likewise for a number of other variables.

### **A Note on County Differences and Statistical Significance**

The county-by-county samples sizes vary from a high of 404 (Orange) to a low of 136 (Lake). The county-specific margins of survey error therefore also vary by county. For the largest county,  $N = 404$ , the 95% confidence intervals around percentages near 50% are  $\pm 4.87$  percentage points. For the smallest county,  $N = 136$ , the corresponding intervals are  $\pm 8.40$  percentage points. For any particular item, there will be at least some missing data and that drops the effective  $N$ s even further.

As a *rule of thumb* (note: rule of thumb, not a precise statistical calculation), any county-specific percentage shown in these tables will therefore come with a margin of error in the range of  $\pm 6$ -7 percentage points, so a percentage difference between any two counties that is less than 12-14 percentage points will **not** be a "statistically significant" difference. For the sample sizes in question, only differences  $\geq \sim 15$  percentage points are worth consideration.

For questions or additional details on any particular item, contact James Wright:
