The Ties that Bind
The Central Florida Social Capital Survey

Marginal Results, Total Survey

By

James D. Wright and Jana L. Jasinski

Fall, 2005

This document contains the marginal frequencies for all questions asked in the Central Florida Social Capital Survey. Please note the following technical details.

The Central Florida Social Capital Survey was a computer-assisted telephone survey conducted by the Survey Research Laboratory in the Institute for Social and Behavioral Sciences at the University of Central Florida. To assure adequate sample sizes, the seven counties were sampled at different rates and the results for the total survey are therefore weighted to compensate for sampling disproportions. The data are also weighted to capture the correct gender balance in each of the seven counties surveyed.

In all, 1,606 interviews were conducted. Of these, 139 were "break-offs," i.e., the respondent stopped answering questions before the end of the survey; complete surveys numbered 1,467. For the total sample (N = 1606), the margin of survey error is ± 2.4 percentage points.

Each frequency table shows four columns of data. "Frequency" shows the raw counts of the number of persons (weighted sample) who gave each answer to each question. "Percent" converts those raw frequencies to the corresponding percentages. "Valid Percent" re-percentages each distribution with all non-valid responses omitted, i.e., those who said don't know, those for whom the question is not applicable, those who refused to answer, those who broke off the interview before the interviewer got to that question, etc. "Cumulative Percent" shows the percentages (of valid responses) that gave the indicated answer *or a preceding answer* to the question.

To illustrate, the second entry in the document shows answers to the question, "Do your old or new friends give you a feeling of belonging?" There were 1,373 yes answers, 195 no answers, 22 who said they had no friends and for whom the question was therefore inapplicable, and 16 who refused to answer the question. Altogether, 1,606 persons were interviewed, of whom 1,569 gave a valid (non-missing) answer. The second column converts the raw results to percentages; thus $1371/1606 = 85.4\%$; $195/1606 = 12.2\%$; etc. Note that non-valid answers were given by a total of 2.3%. The third column omits all the invalid (missing) responses and re-percentages. The "Cumulative Percent" in this case is not meaningful because there are only two answers, so 100% gave either the first or second answer.

In cases where the answers represent true numbers (e.g., q17, "How many days in the past week did you read a newspaper," where the answer can be any number from zero to seven days), the following document also provides the mean, median, mode, standard deviation, etc. for the response frequencies. In the case of reading the newspaper, the mean (average) score is 3.81 days; the median (the 50th percentile value) is 4.0 days; and the mode (single most common response) is seven days. Note that all values reported in these tables are based only on those with a valid (non-missing) response to the item.
